

`\line` *⟨argument⟩*

This command produces an hbox containing *⟨argument⟩*. The hbox is exactly as wide as the current line, i.e., it extends from the right margin to the left margin.

Example:

```
\line{ugly \hfil suburban \hfil sprawl}
```

```
% Without \hfil you'd get an 'underfull box' from this.
```

produces:

```
ugly                suburban                sprawl
```
