

\thinspace

This command produces a positive kern whose width is one-sixth of an em (p. ‘dimdefs’) i.e., it causes T_EX to move its position right by that amount. It is useful when you have a nested quotation, for example, and you want to separate the levels of quotes. T_EX won’t break a line at a \thinspace.

Example:

```
“‘\thinspace‘A quote.’\thinspace’\par  
24,\thinspace 29--31,\thinspace 45,\thinspace 102
```

produces:

```
“‘A quote.’”  
24, 29–31, 45, 102
```
