

\limits

In text style, T_EX normally places limits after a large operator. This command tells T_EX to place limits above and below a large operator rather than after it.

If you specify more than one of `\limits`, `\nolimits`, and `\displaylimits`, the last command rules.

Example:

Suppose that $\bigcap\limits_{i=1}^N q_i$ contains at least two elements.

produces:

Suppose that $\bigcap_{i=1}^N q_i$ contains at least two elements.
