

**\negthinspace**

This command produces a negative kern whose width is one-sixth of an em (p. ‘dimdefs’), i.e., it causes T<sub>E</sub>X to move its position left by that amount. It is useful for bringing together characters that are a little too far apart. T<sub>E</sub>X won’t break a line at a \negthinspace.

*Example:*

The horror, the horror\negthinspace, the horror of it all!

*produces:*

The horror, the horror, the horror of it all!
