

### `\enspace`

This command produces a kern whose width is one en (half of an em, see page ‘dimdefs’). T<sub>E</sub>X won’t break a line at an `\enspace` unless it’s followed by glue. In a bulleted list, the bullets are usually separated from the following text by an `\enspace`.

*Example:*

Lemma 1.`\enspace`There exists a white rabbit.

*produces:*

Lemma 1. There exists a white rabbit.
