

`\smallskipamount` [*⟨glue⟩* parameter]
`\medskipamount` [*⟨glue⟩* parameter]
`\bigskipamount` [*⟨glue⟩* parameter]

These parameters specify the amounts of glue produced by the `\smallskip`, `\medskip`, and `\bigskip` commands. By changing these parameters you change the effect of the commands. The default values (for plain T_EX) correspond to a quarter of a linespace, half a linespace, and a full linespace. We recommend that you maintain this ratio by changing these values whenever you change `\baselineskip` (p. ‘`\baselineskip`’).
