

`\globaldefs` [*⟨number⟩* parameter]

This parameter controls whether or not T_EX takes definitions and other assignments to be global:

- If `\globaldefs` is zero (as it is by default), a definition is global if and only if it is preceded by `\global` either explicitly or implicitly. (The `\gdef` and `\xdef` commands (p. ‘`\gdef`’) have an implicit `\global` prefix).
- If `\globaldefs` is greater than zero, all assignments and definitions are implicitly prefixed by `\global`.
- If `\globaldefs` is less than zero, all `\global` prefixes are ignored.
