

`\mathaccent`  $\langle mathcode \rangle$

This command tells T<sub>E</sub>X to typeset a math accent whose family and character code are given by  $\langle mathcode \rangle$ . (T<sub>E</sub>X ignores the class of the  $\mathcode$ .) See Appendix G of *The T<sub>E</sub>Xbook* for the details of how T<sub>E</sub>X positions such an accent. The usual way to use `\mathaccent` is to put it in a macro definition that gives a name to a math accent.

*Example:*

```
\def\acute{\mathaccent "7013}
```
