1

\mathord	\mathopen
\mathop	\mathclose
\mathbin	\mathpunct
\mathrel	

These commands tell T_EX to treat the construct that follows as belonging to a particular class (see page 154 of *The T_EXbook* for the definition of the classes). They are listed here in the order of the class numbers, from 0 to 6. Their primary effect is to adjust the spacing around the construct to be whatever it is for the specified class.

Example:

```
$\mathop{\rm minmax}\limits_{t \in A \cup B}\,t$ % By treating minmax as a math operator, we can get TeX to % put something underneath it. produces: \min_{t \in A \cup B} t
```
