demerits 1

demerits. TeX uses demerits as a measure of how undesirable a line is when it's breaking a paragraph into lines (see "line break", p. 'line+break'). The demerits of a line are affected both by the badness of the line and by penalties associated with the line. TeX's goal in choosing a particular arrangement of lines is to minimize the total demerits for the paragraph, which it computes by adding up the demerits for the individual lines. See pages 97–98 of The TeXbook for the details of how TeX breaks a paragraph into lines. TeX does not use demerits when it's choosing page breaks; instead, it uses a similar measure known as the "cost" of a particular page break.
