```

These commands cause TEX to typeset the following text in the specified font. Normally you would enclose one of these font-selecting commands in a group, together with the text to be set in the selected font. Outside of a group a font-selecting command is effective until the end of the document (unless you override it with another such command).

Example:

```
See how I've reduced my weight---from 120 lbs.\ to {\sevenrm 140 lbs}.

produces:
See how I've reduced my weight-from 120 lbs. to 140 lbs.
```
