1

\frenchspacing \nonfrenchspacing

TEX normally adjusts the spacing between words to account for punctuation marks. For example, it inserts extra space at the end of a sentence and adds some stretch to the glue following any punctuation mark there. The \frenchspacing command tells TEX to make the interword spacing independent of punctuation, while the \nonfrenchspacing command tells TEX to use its normal spacing rules. If you don't specify \frenchspacing, you'll get TEX's normal spacing.

See page 'periodspacing' for advice on how to control T_EX 's treatment of punctuation at the end of sentences.

Example:

{\frenchspacing An example: two sentences. Right? No.\par} {An example: two sentences. Right? No. \par}% produces:

An example: two sentences. Right? No. An example: two sentences. Right? No.
