1

\newhelp ⟨*control sequence*⟩ { ⟨*help text*⟩ }

This command assigns the help message given by ⟨*help text*⟩ to ⟨*control sequence*⟩. It provides an efficient way of defining the help text that further explains an error message. Before issuing the error message with the \errmessage command, you should assign ⟨*control sequence*⟩ to \errhelp. The help text will then appear if the user types 'H' or 'h' in response to the error message.

Example:

```
\newhelp\pain{Your input includes a token that I find^^J
   to be offensive. Don't bother me again with this^^J
   document until you've removed it.}
\errhelp = \pain \newlinechar = '\^^J
% ^^J will start a new line
\errmessage{I do not appreciate receiving this token}
```

produces in the log:

```
! I do not appreciate receiving this token.
l.8 ...t appreciate receiving this token.}

? H
\Your input includes a token that I find
 to be offensive. Don't bother me again with this
 document until you've removed it.
```
