`\splitfirstmark`
`\splitbotmark`

These commands expand to the mark text generated by an earlier `\mark` command that produced an item in the item list of a vbox V. The mark text has the form of a token list. When TEX splits V in response to a `\vsplit` command (p. '`\vsplit`'), it sets the values of these commands as follows:

- `\splitfirstmark` contains the tokens of the first mark in the item list of V.
- `\splitbotmark` contains the tokens of the last mark in the item list of V.

These commands produce no tokens if there was no preceding `\vsplit`, or if the most recent preceding `\vsplit` didn't contain any marks.
